setting the standard

BFK458 spring-applied brake

The versatile modular system

1.5 - 600 Nm

www.intorq.com

We set the standards

The INTORQ brand stands for reliable brake solutions of the highest standard. Whether in cranes, wind turbines or industrial trucks – INTORQ products are used in the most diverse of applications. Rely on us to create the right solution for your drive – individually and reliably.

With its high number of variants, INTORQ's range of modular products is used in many motors and geared motors and has set standards worldwide. With the establishment of facilities in Shanghai, Atlanta and Pune we have also consistently expanded our international presence. So wherever you are in the world, our network of sales and service staff is always close at hand to support you.

INTORQ at a glance

- Electromagnetic brakes and clutches
- Configurable standard solutions and custom-made solutions
- Development and production centred in Aerzen
- Fast delivery times worldwide thanks to production sites in Shanghai, Atlanta and Pune
- 47 million euros a year sales volume
- 800,000 units a year
- 10,000 square metres production area
- 230 employees
- Market leader with 63 sales partners in 49 countries

BFK458 – The modular system

This modular system forms the basis for a product range that offers versions tailored for almost any task. The BFK458 spring-applied brake, as a standard product, can be used anywhere, but its modular structure also meets the requirements of specific industries. Its strength lies in its versatility.

Electromagnetically released spring-applied brakes are used wherever masses in motion have to be decelerated as quickly as possible or where masses must be held in a defined position. The braking force is applied by tappet springs. Thus the braking torque generated by friction locking remains available in the deenergised status – even in the event of mains failure. The brake is released electromagnetically.

The main components of the modular system are the two basic modules E (adjustable braking torque) and N (non-adjustable braking torque).

The greatest degree of flexibility is achieved for a broad range of applications by combining the basic modules with specific modules. This catalogue is designed to assist you in selecting and ordering your desired spring-applied brake quickly and easily.

Fields of application

- Brake motors
- Conveyors
- Cranes
- Storage technology
- Industrial trucks
- Wood working machines
- Stage machinery
- Vehicles for the disabled
- Automation technology
- Controlled drives
- Gate drives
- Escalators

Wind turbines

Cranes

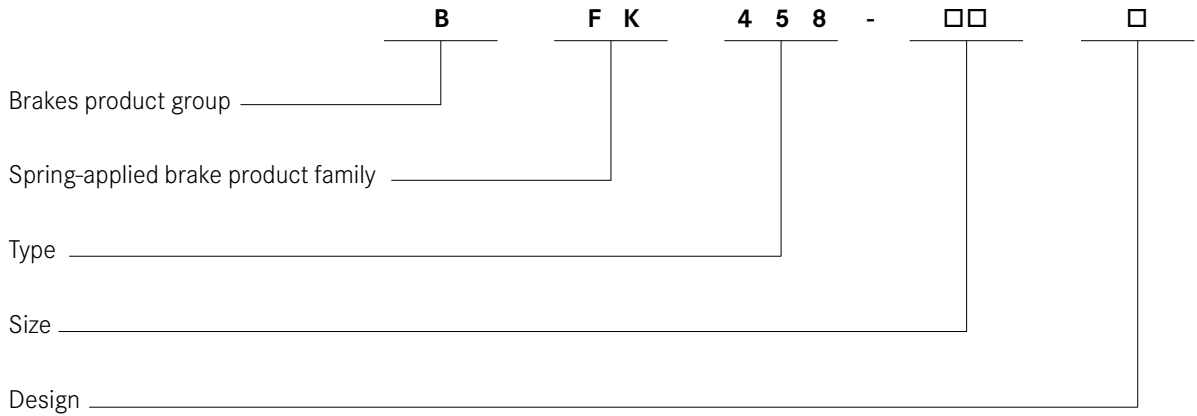

Industrial trucks

Stage machinery

INTORQ BFK458-□□□ product key

Size

06, 08, 10, 12, 14, 16, 18, 20, 25

Not coded:

Supply voltage, hub bore, options

Stator design

E – Adjustable (braking torque can be reduced using torque adjustment ring)

N – Non-adjustable

L – Non-adjustable, LongLife design

List of abbreviations

P_N [W]	Rated coil power at rated voltage and 20°C	SL_N [mm]	Rated air gap
U_N [V DC]	Rated coil voltage	SHL [mm]	Hand-release air gap, setting dimension of hand-release
M_K [Nm]	Rated torque of the brake at a relative speed of 100 r/min	t₁ [s]	Engagement time, the total of the reaction delay and torque rise time $t_1 = t_{11} + t_{12}$
M_L [Nm]	Load torque, torque that the static load produces at the motor shaft	t₂ [s]	Disengagement time, time from switching the stator until the torque has reduced to 0.1 M _K
Δn₀ [r/min]	Initial relative speed of the brake	t₃ [s]	Slipping time to standstill (after t ₁₁)
J_L [kgm ²]	moment of inertia of the load, referred to referred to the output shaft (load shaft)	t₁₁ [s]	Delay time when connecting, time from disconnecting the voltage until the torque begins to rise
Q [J]	Heat/energy	t₁₂ [s]	Rise time of braking torque, time from beginning of rise of torque until braking torque is reached
Q_E [J]	Maximum permissible friction work per switching cycle, thermal rating of the brake		
Q_{smax} [J]	maximum permissible friction work during cyclic switching, depending on the operating frequency		
S_h [1/h]	Operating frequency, the number of repeated operations per unit time		
S_{hmax} [1/h]	Maximum permissible operating frequency, depending on the friction work per operation		

Product information

A powerful and complete range

- 9 sizes
- Standard voltages [V DC] 24, 96, 103, 170, 180, 190, 205
- Graduated torque range from 1.5 - 600 Nm
- Short delivery times for the complete range thanks to optimised logistics
- Enclosure according to IP00 ... IP55, depending on the special operating conditions, see technical data sheet
- **ATEX:** In accordance with Group II, Category 3G/D, the product is suitable for use in potentially explosive atmosphere of zone 2 (gases and vapours) and zone 22 (dust) for steady-state operation (holding or parking brake) and temperature class T4.

Versatile

- Modular structure for virtually all applications

Torque transmission

- Designed for dry running

Quick and easy mounting

- Preset air gap
- Special machining of the friction surfaces ensures that the rated torques are achieved after very few switching operations
- No locating bearing is required on the brake

Durable

- The insulation system to temperature class F (155°C) ensures that the winding has a long service life
- The brakes are designed for 100% duty time (current applied to the brake)

Low maintenance

- Long rotor/hub connection with low rate of wear and a tried-and-tested involute gear
- Asbestos-free and solvent-free friction lining with low rate of wear

Reliable

- The certified ISO 9001 and ISO 14001 quality assurance system provides the basis for consistently high-quality products
- Production and testing to VDE 0580

Options

- Hand release for all sizes, both directions can be used for release and mounting (exception: tachometer brake)
- Noise-reduced designs
- Various types of corrosion protection and enclosures
- Microswitches used to monitor air gap and wear (size 12 and above)
- Monitoring of Hand release function
- Non-standard voltages and bores on request
- Pulse width modulation (PWM), sizes 06 - 18
- Partial discharge free brake has been developed for operation with the pulse width modulated DC bus voltage of a frequency inverter
- Rated coil voltage $U_N=103V$ DC

LongLife design BFK458-L

- Armature plate with low backlash and reinforced torque support
- Tappet springs with guide pins for protection against shearing forces
- Aluminium rotor with toothed intermediate ring: friction lining and tooth system with low rates of wear

 up to -40 °C

CCV (Cold Climate Version), temperature-resistant up to -40 °C

- CCV design configurable for all sizes in the modular system
 - Use of chrome-plated friction surfaces (armature plate and flange)
 - Use of temperature-resistant fixing screws is essential
- The following components are also approved for use up to -40 °C
 - Rotor with sleeve (noise-reduced)
 - Hand release
 - Terminal box
 - Microswitch
 - Caps E and N
 - Shaft sealing rings (available on request)

Functional principle

Basic module E

Basic module N

INTORQ BFK458 spring-applied brakes are single-disk brakes with two friction surfaces. When deenergised, several springs are used to generate the braking torque through friction locking. The brake is released electromagnetically. During braking, the springs use the armature plate to press the rotor (which can be shifted axially on the hub) against the counter friction face. When the brakes are applied, an air gap s_L is present between the armature plate and the stator. The stator's coil is energised with DC voltage in order to release the brake.

The resulting magnetic flux works against the spring force to draw the armature plate to the stator. This releases the rotor from the spring force and allows it to rotate freely. Basic module E supports the use of the torque adjustment ring to reduce the braking torque.

BFK458, redundant and noise-reduced

BFK458, with terminal box

BFK458-L, LongLife for high switching cycles

Technical data

Rated torques

The basic modules E and N are available in the graduated torques listed below. A pole shim (brass film) must be placed between the stator and the armature plate if you want to achieve short engagement times at low torques. INTORQ brakes are dimensioned so that the specified rated torques can usually be achieved reliably after a short running-in period. However, as the organic friction linings used do not all have identical properties and because environmental conditions can vary, deviations from the specified braking

torques are possible. These must be taken into account in the form of appropriate dimensioning tolerances. Increased breakaway torque is common in particular after long downtimes in humid environments where temperatures vary. If the brake is being used on friction surfaces provided by the customer, the rated torque must be checked. If the brake is to be used solely as a holding brake without dynamic load, the friction lining must be reactivated at regular intervals.

Rated torque M_K [Nm]
of the brake, rated value at a
relative speed of 100 r/min

- N ... Braking torque for the N design
(without torque adjustment ring)
- E ... Braking torque for the E design
(with torque adjustment ring)
- L ... LongLife design

Operating brake
(s_{Lmax} approx. $2.5 \times s_{LN}$)

Standard braking torque

Holding brake with emergency
stop (s_{Lmax} approx. $1.5 \times s_{LN}$)

Basic module L, LongLife design

The LongLife design can be configured for sizes 06 to 12 in combination with the specified rated torques in the modular system. The stator corresponds to design N; bores and built-on accessories are not possible at the rear side. It is not possible to configure a microswitch for size 12.

Basic module E, reduced rated torque

The rated torque on basic module E can be reduced using the torque adjustment ring located in the stator. The torque adjustment ring may only be unscrewed to a maximum dimension of $h_{1\max}$ (see table on page 11).

It should be noted that the engagement and disengagement times change in accordance with the rated torque. Torque reduction is independent of the rated torque used.

Size	06	08	10	12	14	16	18	20	25
Torque reduction per detent position [Nm]	0.2	0.35	0.8	1.3	1.7	1.6	3.6	5.6	6.2

Noise-reduced designs

The noise reduction required in many applications can be achieved in two ways:

1. Impact-noise-reduced armature plate

The brake's operating noise can be minimised using special damping elements, which are installed between the pole face and the armature plate as shock absorbers.

2. Noise-reduced aluminium rotor

The rotor with plastic sleeve reduces the rattling noises in the rotor/hub connection. At the same time, this increases the service life of this connection.

Features and advantages

- Low rate of wear between rotor and hub
- Recommended for frequency inverter operation
- Noise-reduced design
- Also available in combination with CCV

Q_{BW} [10 ⁶ J]	85	158	264	530	571	966	1542	2322	3522
S_{hue} [h ⁻¹]	79	50	40	30	28	27	20	19	15

Q_{BW} = Friction energy of brake until maintenance
 S_{hue} = Transitional operating frequency

In the region of the load limit (operation > 50% Q_E) the value for Q_{BW} can drop as low as 40%

Technical data

Service life and wear

Friction energy and operating frequency

$$S_{h\max} = \frac{-S_{hue}}{\ln\left(1 - \frac{Q_R}{Q_E}\right)} \quad Q_{s\max} = Q_E \left(1 - e^{-\frac{S_{hue}}{S_h}}\right)$$

The maximum permissible operating frequency $S_{h\max}$ depends on the braking energy Q_R . The operating frequency S_h results in the maximum permissible friction work during cyclic switching $Q_{s\max}$. Higher speed and switching energy values increase wear, because the friction surfaces are briefly subjected to very high temperatures.

Maintenance

Brakes are components which are subject to a great deal of wear. When installing the brake, it must be ensured that it can be easily accessed for inspection and maintenance purposes. Intervals between inspections should be set in accordance with the expected service life and load. For more information, please see the operating instructions.

The brake has to be adjusted when $s_{L\max}$ is reached. The friction energy to be withstood up to this point is dependent on a number of factors: in particular, the inertias to be braked, the braking speed, the operating frequency and the resulting temperature on the friction surfaces. For this reason, no universal value for all operating conditions can be given in respect of the amount of friction energy that can be handled before adjustment is required. In addition, increased wear should be expected with a vertical brake shaft. The BFK458 can be adjusted when the maximum permissible working air gap is reached ($s_{L\max}$). The dimensioning of the friction lining allows it to be readjusted at least 5 times.

Where the amount of friction energy per switching operation is low, the brake's mechanical components can impose limitations in terms of service life. In particular, the rotor/hub connection, springs, armature plate and sleeves are subject to operational wear. The expected service life of the standard design is around 1 million load alternations. Solutions that are optimised in terms of service life are available in cases where a longer service life is required (consult the manufacturer).

BFK458-L

Guaranteed performance data for the LongLife design

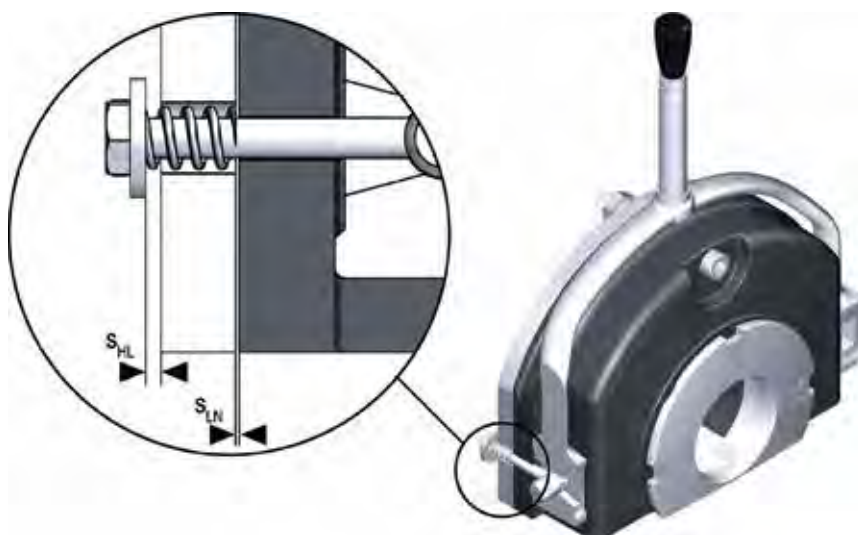

- Guaranteed service life of brake mechanism:
 - 10x10⁶ repetitive cycles of operation
 - 15x10⁶ reversing cycles of operation
- The brake warranty covers either a period of two years or the guaranteed number of cycles – whichever is reached first.
- The scope of the warranty in the event of premature failure covers replacement of the brake, including a flat-rate replacement fee

Accessories

Hand release

The hand release is used to release the brake by hand and can be retrofitted. The hand release springs back to its base position automatically after operation (1). The hand release requires an additional air gap S_{HL} in order to function; this is factory-set prior to delivery. Dimension S_{HL} (see the mounting instructions) must be checked once the equipment has been mounted.

Size	$S_{LN}^{+0.1}_{-0.05}$ [mm]	$S_{HL}^{+0.1}$ [mm]
06 08 10	0.2	1
12 14 16	0.3	1.5
18 20	0.4	2
25	0.5	2.5

Flange

A flange can be used if no suitable counter friction face is available. The flange can also be fitted with a cover ring.

Friction plate

A friction plate is available for sizes 06 up to and including 16. This should be used if the counter face is smooth and machined, but is not suitable as a friction surface. The plate can be combined with a cover ring.

Flange

Friction plate
(sizes 06 - 16)

Accessories

Seal

To a large extent, the cover ring prevents the exit or ingress of dust, humidity, dirt, etc., out of or into the braking area. The seal is inserted into the groove on the stator. If no suitable groove is available on the counter friction face, we recommend the use of a flange or a friction plate.

Seal

Connection flange (double brake)

The connection flange can be used to adapt a second basic module to basic module N; the resulting double brake is suitable for use in stage machinery or other applications with increased safety requirements.

Connection flange

Centring flange (tacho brake)

Basic module N combined with a centring flange is suitable for mounting a tacho generator.

Centring flange

Accessories

Brake cover

A brake cover can be mounted onto basic module E and basic module N as an option, to protect the brake from water and dust (degree of protection acc. to IP65). This design is not available in conjunction with a hand release and a flange.

¹⁾ Recommended recess length on motor end shield

Accessories

Microswitch

The brake can be fitted with a microswitch for the purpose of monitoring the release or wear. The microswitch can be built into the circuit as an NC contact or an NO contact.

As of June 2012, a new small microswitch (with UL acceptance) is in use, which is perfectly adapted to the contour of the brake. The old switch design can be converted by connecting an adapter to the same threaded holes.

Mounting the microswitch onto basic module E

Microswitch for hand release monitoring in combination with basic module N

Gate drives, for instance, are provided with brakes with hand release, and a microswitch for monitoring the hand release. In this case, the hand release must make it possible to move the gate to the desired position in manual operation, e.g. using a crank. This manual operation has to be detected via a microswitch, whose switching signal must be combined with the motor control so that the motor can be prevented from starting (thus also preventing any possible injury to the operator). The microswitch for hand release monitoring is a built-on option.

The fixing bracket is screwed onto the stator via the threaded holes on the rear face. The fixing bracket enables a microswitch to be fastened to it. The two directions of release, towards and away from the motor, can be implemented by using different fixing brackets and microswitch settings.

Accessories

Terminal box in combination with basic module N

The connecting cables can easily be integrated into higher-level controls via the terminal box (brake sizes 12-25) in order to support different wiring options (total of 3 inputs/outputs). 2/4-pole terminal strips, 4-pole half-wave and bridge rectifiers and a microswitch connection can be integrated into the terminal box at the customer's request.

The terminal box is mounted on the spring-applied brake using a fixing bracket and screws, as shown in the illustration. You can select the mounting angle according to your requirements by using the assembly kit.

INTORQ 14.198.00 universal spark suppressor

The universal spark suppressor limits the induced voltage arising when inductive direct current consumers are switched off on the DC side. These induced voltages can damage coils and switches. VDE 0580 therefore requires

that, in order to avoid impermissibly high switch-off voltages and overvoltages, suitable protective measures must be provided by the user. The universal spark suppressor is available in 4 versions for the following voltage ranges:

INTORQ	Coil voltage [V DC]	Max. connection voltage	Max. coil power [W]	Capacitor-voltage	b	b ₁ approx.	d	e approx.	h	l	l ₁ approx.	m [g]

* Spark suppressor without capacitor. For optimum spark suppression, we recommend the use of spark suppressor 14.198.00.04

Max. rated coil voltage: 250 V
Standard rated voltages: 24, 96, 103, 170, 180, 190, 205 V

Dimensioning

Basics

A brake is dimensioned essentially on the basis of the required braking torque M_{erf} .

The inertias to be braked (moments of inertia), the relative speeds, the braking times and the operating frequencies also have to be considered in the calculations. Marginal conditions, such as ambient temperature, air humidity, dust and mounting position should be known. In the event of extreme/critical operating conditions, please consult the manufacturer. The brake is dimensioned in accordance with VDI guideline 2241.

Friction surfaces must always be kept free of oil and grease.

For explanations of the terms used in the calculation, please refer to the list of abbreviations on page 5.

Safety factor

To ensure the necessary transmission security even under extreme operating conditions, braking torque need to include the safety factor K , the value of which should be set dependent upon the operating conditions.

$$K \geq 2$$

Load types

The following load types are primarily encountered in practice:

$$M_{\text{erf}} = M_a \cdot K \leq M_K$$

$$M_a = \frac{J_L \cdot \Delta n_0}{9.55 \cdot \left(t_3 - \frac{t_{12}}{2} \right)}$$

$$M_{\text{erf}} = \frac{J_L \cdot \Delta n_0}{9.55 \cdot \left(t_3 - \frac{t_{12}}{2} \right)} \cdot K$$

Dynamic and static load

Most applications belong to this category, as in most cases there is not only a static torque but also a dynamic load.

$$M_{\text{erf}} = (M_a \pm M_L) \cdot K \leq M_K$$

$$M_{\text{erf}} = \left(\frac{J_L \cdot \Delta n_0}{9.55 \cdot \left(t_3 - \frac{t_{12}}{2} \right)} \pm M_L \right) \cdot K \leq M_K$$

+ M_L = To be used with driving load torque
(e.g. when lowering a load)

- M_L = For braking operation

Estimating the required braking torque and/or size

If only the drive power to be transmitted is known, the required torque or braking torque can be determined as follows:

$$M_{\text{erf}} = 9550 \frac{P}{\Delta n_0} \cdot K \leq M_K$$

Thermal load

If high operating frequencies and friction energy/switching cycle are to be expected, we recommend recalculating the thermal data for the brake. The friction energy per switching cycle is calculated as follows:

$$Q = \frac{J_L \cdot \Delta n_0^2}{182.5} \cdot \frac{M_K}{M_K \pm M_L}$$

- M_L = To be used when lowering the load, for example
+ M_L = For braking operation

The permissible friction energy per switching cycle at a given operating frequency can be taken from the diagrams on page 14. If the friction energy per switching cycle is known, the permissible operating frequency can be taken from the diagrams mentioned above.

Dimensioning

Example calculation

The following technical data is known:

$$P = 3 \text{ kW}$$

$$\Delta n_0 = 1450 \text{ rpm}$$

$$J_L = 0.13 \text{ kgm}^2 \text{ total}$$

$$t_3 = 2 \text{ s}$$

$$M_L = 15 \text{ Nm}$$

$$S_h = 100 \text{ switching operations/h}$$

Estimating the required braking torque and/or size

$$M_{\text{erf}} = 9550 \frac{P}{\Delta n_0} \cdot K$$

$$M_{\text{erf}} = 9550 \frac{3}{1450} \cdot 2 = 40 \text{ Nm}$$

Assume BFK458-14

Determining the required braking torque

$$M_{\text{erf}} = \left(\frac{J_L \cdot \Delta n_0}{9.55 \cdot \left(t_{12} \frac{t_{12}}{2} \right)} + M_L \right) \cdot K$$

$t_{12} = 0.025 \text{ s}$ (see page 14)

$$M_{\text{erf}} = \left(\frac{0.13 \cdot 1450}{9.55 \cdot \left(2 \cdot \frac{0.025}{2} \right)} + 15 \right) \cdot 2 = 50 \text{ Nm}$$

Therefore, BFK458-14 is chosen.

$$M_K = 60 \text{ Nm} > M_{\text{erf}} = 50 \text{ Nm}$$

Thermal recalculation

$$Q = \frac{J_L \cdot \Delta n_0^2}{182.5} \cdot \frac{M_K}{M_K \pm M_L}$$

$$Q = \frac{0.13 \cdot 1450^2}{182.5} \cdot \frac{60}{(60 - 15)} = 1997 \text{ J}$$

Calculated switching energy $Q = 1997 \text{ J}$ /switching cycle.

The diagram on page 18 shows a max. permissible friction work of 7,326 J for size 14 at $S_h = 100 \text{ h}^{-1}$.

$$Q = 1997 \text{ J} < Q_{\text{Smax}} = 7326 \text{ J}$$

The brake is correctly dimensioned.

Example order

Brake type BFK458-14E or design N (with or without torque adjustment ring) is required, with additional hand release and seal ring.

Supply voltage 205 V =, shaft diameter 25 mm.

BFK458-14E, 205 V =, d = 25 mm

Product overview

BFK458 spring-applied brake

Setting standards in the market, worldwide

We are available to our customers at all times and in all locations. Major customers and projects are supported directly by our Key Account Sales Team at our HQ in Aerzen (Germany) or by our locations in Shanghai (China), Atlanta (USA) and Pune (India).

In addition to this, we work with a global network of local trading partners and cooperate with Lenze's global sales organisation.

Please send service requests directly to your local sales partner or to our HQ in Aerzen, Germany:
